It is the responsibility of the contractor to employ sufficient men for the works ordered so that the targets, for completion of work as prescribed shall be met.

9. **SAFETY PRECAUTIONS:**

Safety Precautions when excavating or working in excavations close to electric cables

The Engineer-in-charge of the work should get full information from Electricity **undertaking** regarding any electric cables, which are known or suspected to exist near the proposed excavation and unless this is done, excavation should not be carried out in the section concerned. The electricity undertaking should be asked to send a representative and work should be proceeded with close consultation with them. Only wooden handled hand tools should be used until the electric cables have been completely exposed. Power cables, not laid in conduits, are usually protected from top by a cover slab of concrete, brick or stone. They may or may not be protected on the sides. It is safer, therefore, always drive the point of the pickaxe downwards then uncovering a cable, so that there is less chance of missing such warning slabs. No workman should be permitted to work alone where there are electric cables involved. At least one more man should be working nearby so that help can be given quickly in case of an accident. If disconnection of power could be arranged in that section it will be better. No electric cables shall be moved or altered without the consent of the electric Authority and they should be contacted to do the needful. If an electric cable is damaged even slightly, it should be reported to the electric Authority and any warning bricks disturbed during excavation should be replaced while back filling the trench. Before driving a spike into the ground, the presence of other underground properties should be checked. Information on plans regarding the location of power cables need not to be assumed as wholly accurate. Full precautions should be taken in the Vicinity until the power cable is uncovered. All electric cables should be regarded as being live and consequently dangerous. Any power is generally dangerous, even low voltage proving fatal in several cases.

Electric shock – Action and treatment: Free the victim from the contact as quickly as possible. He should be jerked away from the live conductors by dry timber, dry rope or dry clothing. Care should be taken not to touch with bare hands. Artificial respiration should begin immediately to restore breathing even if life appears to be extinct. Every moment of delay is serious, so a doctor should be called for immediately.

Safety precautions while working in Public Street and along railway lines: Where a road or

footpath is to be opened up in the course of work, special care should be taken to see that proper protection is provided to prevent any accidents from occurring. Excavation work should be done in such a manner that it will not unduly cause inconvenience to pedestrians or occupants of buildings or obstruct road traffic. Suitable bridges over open trenches should be so planned that these are required for the minimum possible time. Where bridges are constructed to accommodate vehicular traffic and is done near or on railway property, it should be with the full consent and knowledge of the competent railway authorities.

Danger from falling material: Care should be taken to see that apparatus, tools or other excavating implements or excavated materials are not left in a dangerous or insecure position so as to fall or be knocked into the trench there by injuring any workman who may be working inside the trench.

Care when working in Excavations: Jumping into a trench is dangerous. If it is deep, workmen should be encouraged to lower themselves. Workers should work at safe distance so as to avoid striking each other accidentally with tools. If the walls of the trench contain glass bits, corroded wire or sharp objects they should be removed carefully. If an obstruction is encountered, it should be carefully uncovered and protected if necessary. Care must be taken to see that excavated material is not left in such a position that it is likely to cause any accident or obstruction to a roadway or waterway. If possible the excavated material should be put between the workmen and the traffic without encroaching too much on the road.

Danger of cave in: When working in deep trenches in loose soil, timbering up/ shoring the sides will prevent soil subsidence. The excavated material should be kept at sufficient distance from the edge of the trench or pit, vehicles or heavy equipment must not be permitted to approach too close to the Excavation. When making tunneled opening, it should be ensured that the soil is compact enough to prevent cave in even under adverse conditions of traffic. Extra care should be taken while excavating near the foundations of buildings or retaining walls. In such cases, excavation should be done gradually and as far as possible in the presence of the owners of the property.

Protection of Excavations : Excavations in populated areas, which are not likely to be filled up on the same day should be protected by barriers or other effective means of preventing accidents and the location of all such openings must in any event be indicated by red flag or other suitable warning signs. During the hours from dusk to dawn adequate number of red warning lamps should be displayed. Supervisory officers should ensure that all excavations are adequately protected in this manner as serious risk and responsibility is involved. Notwithstanding adoption of the above mentioned precautions, works involving excavations should be so arranged as to keep the extent of opened ground and the time to open it to a minimum.

Precautions while working on roads :The period between half an hour after sun-set and half an hour before sunrise, and any period of abnormal darkness may also be considered as night for the purpose of these instructions, for the purpose of providing the warning signs. Excavation liable to cause danger to vehicles or the public must at all times be protected with fencing of rope tied to strong upright or bamboo poles at a suitable height or by some other effective means. Any such temporary erection which is likely to cause obstructions and which is not readily visible should be marked by posts carrying red flags or boards with a red background by day and by continuously lighted lamps at night. The flags and the lamps should be placed in conspicuous positions so as to indicate the pedestrians and drivers of

vehicles the full expanse i.e. both width and length of the obstruction. The distance between lamps or between floors should not generally exceed 1.25m along the width and 6m along length of the obstruction in non-congested areas, but 4 meters along the length in congested areas. If the excavation is extensive, sufficient notice to give adequate warning of the danger should be displayed conspicuously not less than 1.25m above the ground and closed to the excavation. Where any excavation is not clearly visible for a distance of 25m to traffic approaching from any direction or any part of the carriage way of the road in which the excavation exists, a warning notice should be placed on the kerb or edge of all such roads from which the excavation or as near the distance as is practicable but not less than 10m from the junction of an entering or intersecting road in which the excavation exists. All warnings, in these should have a red background and should be clearly visible and legible. All warning lamps should exhibit a red light, but white lights may be used in addition to facilitate working at night. Wherever required a passage for pedestrians with footbridge should be provided. At excavations, cable drums, tools and all materials likely to offer obstructions should be properly folded round and protected. This applies to jointer's tents as well. Leads, hoses etc. stretched and across the carriageway should be guarded adequately for their own protection and also that of the public.

Traffic Control: The police authorities are normally responsible for the control of traffic and may require the setting up of traffic controls to reduce the inconvenience occasioned by establishment of a single line of traffic due to restriction in road width or any other form of obstruction caused by the work. As far as possible, such arrangements should be settled in advance. If there are any specific regulations imposed by the local authorities, these should be followed.

10. SPECIAL NOTE & PRECAUTIONS

SECTION III**Part B****TECHNICAL SPECIFICATIONS****1. INSTALLATION OF JOINT CLOSURE & SPLICING OF OFC:-**

Fusion splicing is used for splicing the fibre in BSNL network. This is accomplished by applying localized heating (i.e., by electric arc or flame) at the interface between two butted, pre-aligned fibre ends, causing them to soften and fuse together. For this purpose fusion splicing machine is used.

There are various types of joint closures in use for BSNL, namely SJC (Straight Joint Closure) and BJC (Branch Joint Closure). The SJCs are predominantly used along the cable routes, and the BJCs are used where ever, the fibre toppings and branching of cable is required. The Procedure for assembly of joint closures is generally supplied by the manufacturers along with the joint closures. However the general procedure for assembly of joint closure is described below:

1.1 Jointing of OF CABLE

The manufacturer's manual contains the following:

- a) Material inside joint closure kit.
- b) Installation tools required.
- c) Detailed procedure for cable jointing.
- d) Procedure for re-opening the closure.

1.2 However, generally, the following steps are involved for jointing of the cable.

- a) Preparation of cable for jointing.
- b) Stripping/cutting the cable.
- c) Preparation of cable and joint closure for splicing.
- d) Fibre splicing.
- e) Organizing fibres and finishing joints.
- f) Sealing of joint closure end.
- g) Placing joint in pit.
- h) Marking of cable end.
- i) Marking of fibres in tray.

1.3 PREPARATION OF CABLE FOR JOINTING:-

1.2.1 During the installation, a minimum of 10 meters of cable of each end is coiled in the jointing pit to provide for jointing to be carried out at convenient location as well as spare length to be available for future use in case of failures.

1.2.2 The pit size must be chosen carefully to ensure the length of the way on which joint is mounted is greater than closure length plus twice the minimum bending radius of the cable. A pit length of 1.2 meter is sufficient for most of the cable and joint closures. Bracket to support the cable coil are also fixed on the wall of the pit.

1.2.3 The cable is then coiled on to the pit wall in the same position as required after the joint is complete. The marking is done on all the loops so that it will be easier to install it later.

1.2.4 The distance from the last centre to the end of the cable must be at least 1.8 meter. This is being the minimum to be stripped for preparation of joint.

1.2.5 Sufficient cable at each end up to the jointing vehicle/enclosure is then uncoiled from the pit for jointing.

1.3 STRIPPING/ CUTTING OF THE CABLE:-

1.3.1 The cable is stripped of their outer and inner sheath with each sheath, staggered approximately 10mm from the one above it.

1.4.2 Proper care must be taken when removing the inner sheath, to ensure the fibres are not scratched or cut with the stripping knife or tool. To prevent this, it is best to only score the inner sheath twice on opposite sides of the cable, rather than cut completely through it. The two scores marking on either side of the cable are then stripped of the inner sheath by hand quite easily.

1.4.3 The fibres are then removed from cable one by one and each fibre is cleaned individually using isopropyl solution to remove the jelly.

1.5 PREPARATION OF CABLE JOINT CLOSURE FOR SPLICING:

The type of preparation work performed on the cable prior to splicing differs on the type of joint closure and fibre organizer used. However, the following steps are usually common:

1.5.1 The strength member of each cable is to be fixed to the central frame of the joint.

1.5.2 The sealing compound or heat shrink sleeve is applied to the cables and closure or prepared for application after splicing is complete.

1.5.3 The fibres are protected (usually with plastic tubing) in their run from the cable core to the fibre organizer trays (particularly if cable construction is slotted core type). Two Nos of plastic tie shall be used to hold fibre tube with splicing tray.

1.5.4 Tags which identify the fibres numbers are attached at suitable locations on the fibres.

1.5.5 Splice protectors are slipped over each fibre in readiness for splicing over the bare fibre after splicing.

1.6 STRIPPING AND CLEANING OF FIBRE:

1.6.1 Prior to splicing each fibre must have approximately 50mm of its primary protective U.V. cured coating removed, using fibre stripper which are manufactured to fine tolerances and only score the coating without contacting the glass fibre.

1.6.2 The bare fibre is then wiped with a lint free tissue doused with ethyl alcohol.

1.6.3 Cleaving of the fibre is then performed to obtain as close as possible to a perfect 90 face on the fibre.

1.7 FUSION SPLICING OF THE FIBRE:-

Some of the general steps with full automatic micro processor control splicing machine are as under:

- 1.7.1 Wash hands thoroughly prior to connecting this procedure.
- 1.7.2 Place the bare fibre inside 'V' groove of the splicing machine by opening clamp handle such that the end of fibre is app.1 mm. over the end of the 'V' groove towards the electrodes.
- 1.7.3 Repeat the same procedure for other fibre, however first insert heat shrink splice protector.
- 1.7.4 Press the start button on the splice controller.
- 1.7.5 The machine will pre fuse, set align both in 'X' and 'Y' direction and then finally fuse the fibre.
- 1.7.6 Inspect the splice on monitor if provided on the fusion splicing machine and assure no nicking, bulging is there and cores appear to be adequately aligned if the splice does not visually look good repeat the above procedure.
- 1.7.7 Slide the heat shrink protector over the splice and place in tube heater. Heat is complete when soft inner layer is seen to be 'oozing' out of the ends of the outer layer of the protector.
- 1.7.8 Repeat the same procedure for all the other fibres.

1.8 ORGANISING FIBRE AND FINISHING JOINTS:-

- 1.8.1 After each fibre is spliced, the heat shrink protection sleeve must be slipped over the bare fibre before any handling of fibre takes place, as uncoated fibres are very brittle and cannot withstand small radius bends without breaking.
- 1.8.2 The fibre is then organized into its tray by coiling the fibres on each side of the protection sleeve using the full tray side to ensure the maximum radius possible for fibre coils.
- 1.8.3 The tray is placed in the position.
- 1.8.4 OTDR reading taken for all splices in this organized state and recorded on the test sheet to confirm that all fibres attenuation are within 0.1 db per splice. This OTDR test confirms fibres were not subjected to excessive stress during the organizing process.
- 1.8.5 The splice loss measurement on each to fibre is also to be taken from the terminal station using power meter to determine the splice loss of each fibre < 0.1 db.
- 1.8.6 Only after satisfactory confirmation of the splice loss within limits i.e. 0.1 db using power meter, the joint pit is to be closed with proper sealing,

1.9 PLACING OF COMPLETED JOINT IN PIT: -

- 1.9.1 Joint is taken out from the vehicle and placed on the tarpaulin provided near the pit.
- 1.9.2 The cable is laid on the ground; coil the cable such that pen mark previously placed on the cable line up. Tape these loops together at the top of the coil.
- 1.9.3 The joint can now be permanently closed and sealed by heating heat shrinkable sleeve etc.
- 1.9.4 If required for attending to faults etc., manufacturers supply special kits for opening of the joint and the steps to be followed. However the general steps are as under:

No.AGM (MM)/T-93/Safe City East/2023-24/02 dtd. @ BG - 01, the 18.11.2023

- a) Using suitable knife cut heat shrink sleeve longitudinally along its entire length.
- b) Do not damage the smaller heat shrunk sleeve on the ends of the joint.
- c) Apply heat to the cut sleeve until it begins to separate.
- d) Gently remove the cut sleeve from the joint. Now the joint can be opened.
- e) Protective sleeve/cover can be removed for attending to faults etc.

1.10 TERMINATION OF CABLE ON OPTICAL FDF, PILLAR OR DPs

1.10.1 Stripping and preparation of cable as per 1.2 above.

1.10.2 Installation of FDF, Pillar, Pole, DP as per manual

7. Special Note on Security of Bids

Security related functionality has been rigorously implemented in ETS in a multi-dimensional manner. Starting with 'Acceptance of Registration by the Service Provider', provision for security has been made at various stages in Electronic Tender's software. Security related aspects as regard Bid Submission are outlined below:

As part of the Electronic Encrypter™ functionality, the contents of both the 'Electronic Forms' and the 'Main-Bid' are securely encrypted using a Pass-Phrase created by the Bidder himself.

Unlike a 'password', a Pass-Phrase can be a multi-word sentence with spaces between words (e.g. I love this World). A Pass-Phrase is easier to remember, and more difficult to break. It is recommended that a separate Pass-Phrase be created for each Bid-Part. This method of bid-encryption does not have the security and data-integrity related vulnerabilities which are inherent in e-tendering systems which use Public-Key of the specified officer of a Buyer organization for bid-encryption. Bid-encryption in CPPP is such that the Bids cannot be decrypted before the Public Online Tender Opening Event (TOE), even if there is connivance between the concerned tender-opening officers of the Buyer organization and the personnel of e-tendering service provider.

Typically, 'Pass-Phrase' of the Bid-Part to be opened during a particular Public Online Tender Opening Event (TOE) is furnished online by each bidder during the TOE itself, when demanded by the concerned Tender Opening Officers who will open the bid. Else Tender Opening Officer may authorize the bidder to open his bid himself.

There is an additional protection with SSL Encryption during transit from the client-end computer of a Supplier organization to the e-tendering server/ portal.

8. Public Online Tender Opening Event (TOE)

ETS offers a unique facility for 'Public Online Tender Opening Event (TOE)'. Tender Opening Officers as well as authorized representatives of bidders can attend the Public Online Tender Opening Event (TOE) from the comfort of their offices. For this purpose, representatives of bidders (i.e. Supplier organization) duly authorized are requested to carry a Laptop and Wireless Connectivity to Internet.

Every legal requirement for a transparent and secure 'Public Online Tender Opening Event (TOE)' has been implemented on ETS. As soon as a Bid is decrypted with the corresponding 'Pass-Phrase' as submitted online by the bidder himself (during the TOE itself), salient points of the Bids are simultaneously made available for downloading by all participating bidders. The work of taking notes during a manual 'Tender Opening Event' is therefore replaced with this superior and convenient form of 'Public Online Tender Opening Event (TOE)'.

ETS has a unique facility of 'Online Comparison Chart' which is dynamically updated as each online bid is opened. The format of the chart is based on inputs provided for each Tender. The information in the Comparison Chart is based on the data submitted by the Bidders in electronic forms. A detailed Technical and/ or Financial Comparison Chart enhance Transparency. Detailed instructions are given on relevant screens.

ETS (CPPP) has a unique facility of a detailed report titled 'Minutes of Online Tender Opening Event (TOE)' covering all important activities of 'Online Tender Opening Event (TOE)'. This is available to all participating bidders for 'Viewing/ Downloading'.

NOTE: In case of internet related problem at a bidder's end, especially during 'critical events' such as – a short period before bid-submission deadline, during online public tender opening event, during e-auction, it is the bidder's responsibility to have backup internet connections. In case there is a problem at the e-procurement/ e-auction service-provider's end (in the server, leased line, etc) due to which all the bidders face a problem during critical events, and this is brought to the notice of BSNL by the bidders in time, then BSNL will promptly re-schedule the affected event(s).

9. E-Reverse Auction:

Note: This Clause is not applicable to this tender.
